

Project Design Phase Proposed Solution Template

Date	5 July 2026
Team ID	
Project Name	Credit Card Approval Prediction
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	To automate accurate and efficient credit card approval decisions using machine learning, reducing manual effort and human error.
2.	Idea / Solution description	Develop an AI-powered Credit Card Approval Prediction System that uses machine learning to instantly predict credit card application approval or rejection based on applicant data.
3.	Novelty / Uniqueness	Unlike traditional manual credit evaluation methods that rely on fixed rules and human judgment, the Credit Card Approval Prediction System uses machine learning to provide fast, consistent, and data-driven approval decisions. It compares multiple classification algorithms to select the best-performing model and is designed for future integration with banking APIs, explainable AI, cloud deployment, and real-time model updates.
4.	Social Impact / Customer Satisfaction	It enables faster, fairer, and more accurate credit card approval decisions, improving customer experience while reducing banks' manual workload.
5.	Business Model (Revenue Model)	The application can follow an enterprise licensing or SaaS model, where banks and financial institutions use the platform for automated credit card approval, with premium

		features such as advanced analytics, API integration, and cloud deployment offered through subscription plans.
6.	Scalability of the Solution	The Credit Card Approval Prediction System is designed with a modular Flask and Machine Learning architecture, making it scalable for deployment across banks and financial institutions. Future enhancements include cloud-native deployment, mobile application support, multilingual interfaces, real-time API integration with banking systems, explainable AI for prediction transparency, and continuous model retraining using new applicant data.
